Received 3 June 2009; accepted 22 June 2009; Available online 18 August 2009

Keywords: Endocarditis; Mitral valve; Fistula

A 13-year-old boy presented with a 2-month dyspnoea history.

The echocardiogram revealed a sacular structure of the anterior mitral leaflet bulging into left atrium. An aneurysm was identified in the posterior paracommissural position, above A3, which ruptured into the left atrium (Fig. 1). The aneurysm and fistula were successfully closed (Video).

Fig. 1. Intra-operative photograph with atrial view of the aneurysm, already partially de-roofed. A fistula from the left ventricle can be seen in the floor of the aneurysm.
