When the sky falls on one’s head

Manuel J. Antunes *, Luís Eugénio, J. Ferrão de Oliveira

Cardiothoracic Surgery, University Hospital, Coimbra, Portugal

Received 22 January 2007; received in revised form 1 March 2007; accepted 6 March 2007; Available online 6 April 2007

Keywords: Chest; Chest wall; Trauma

A bunch of steel rods fell over a building-construction worker. One (diameter 25 mm) penetrated his right eyebrow and entered the neck and left chest and upper abdominal cavities. Another penetrated through the right shoulder and chest (Figs. 1 and 2). He was discharged the sixth day after surgery with mild diplopia.

---

Fig. 1. Immediate preoperative photograph of the patient. One rod (diameter 30 mm) penetrated just above his right eyebrow.

Fig. 2. Chest X-ray showing the steel bars, one in the neck and left chest and upper abdominal cavities, and the other in the right chest. During surgery, both were carefully removed under vision. The larger one had injured the distal anterior wall of the trachea, which was simply sutured. No other significant organ injury was identified.
